Seven Bridges of Königsberg

- The **Seven Bridges of Königsberg** is a notable historical problem in mathematics. The problem was to find a walk through the city that would cross each bridge once and only once. The islands could not be reached by any route other than the bridges, and every bridge must have been crossed completely every time.

Euler's Analysis

- During any walk in the graph, the number of times one enters a non-terminal vertex equals the number of times one leaves it.
- If every bridge is traversed exactly once it follows that for each land mass (except possibly for the ones chosen for the start and finish), the number of bridges touching that land mass is **even**.
- However, all the four land masses in the original problem are touched by an **odd** number of bridges (one is touched by 5 bridges and the other three by 3). Since at most two land masses can serve as the endpoints of a putative walk, the existence of a walk traversing each bridge once leads to a contradiction.

Eulerian path

- In graph theory, an **Eulerian trail** is a trail in a graph which visits every edge exactly once. Similarly, an **Eulerian circuit** or **Eulerian cycle** is a Eulerian trail which starts and ends on the same vertex.
-

What is a Graph?

- A graph $G = (V, E)$ is composed of:
 - V : set of vertices
 - E : set of edges connecting the vertices in V
- An edge $e = (u, v)$ is a pair of vertices. Edges are sometimes referred to as arcs.

$$V = \{a, b, c, d, e\}$$

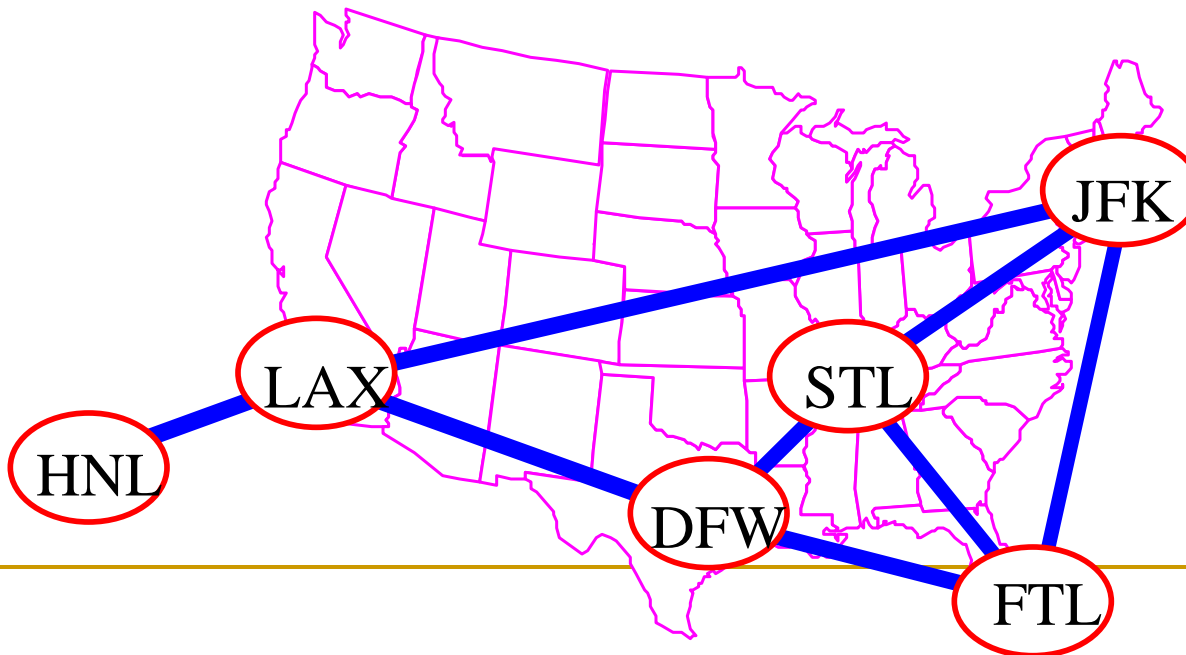

$$E = \{(a, b), (a, c), (a, d), (b, e), (c, d), (c, e), (d, e)\}$$

Applications

- electronic circuits

- networks (roads, flights, communications)

Directed Vs. Undirected Graph

- An **undirected graph** is one in which the pair of vertices in a edge is unordered, $(v_0, v_1) = (v_1, v_0)$
- A **directed graph** is one in which each edge is a directed pair of vertices, $\langle v_0, v_1 \rangle \neq \langle v_1, v_0 \rangle$

Terminology: Adjacent

- If (v_0, v_1) is an edge in an undirected graph,
 - v_0 and v_1 are **adjacent**
 - The edge (v_0, v_1) is incident on vertices v_0 and v_1
- If $\langle v_0, v_1 \rangle$ is an edge in a directed graph
 - v_0 is **adjacent to** v_1 , and v_1 is **adjacent from** v_0
 - The edge $\langle v_0, v_1 \rangle$ is incident on v_0 and v_1

Degree of a Vertex

- The **degree** of a vertex is the number of edges incident to that vertex
- For directed graph,
 - the **in-degree** of a vertex v is the number of edges that have v as the head
 - the **out-degree** of a vertex v is the number of edges that have v as the tail
 - if d_i is the degree of a vertex i in a graph G with n vertices and e edges, the number of edges is

$$e = \left(\sum_{i=0}^{n-1} d_i \right) / 2$$

Why? Since adjacent vertices each count the adjoining edge, it will be counted twice

Examples

directed graph
in-degree
out-degree

in:1, out: 1

in: 1, out: 2

in: 1, out: 0

G_3

Path

- **path**: sequence of vertices v_1, v_2, \dots, v_k such that consecutive vertices v_i and v_{i+1} are adjacent. The length of such a path is the number of edges on the path, which is equal to $k-1$. We allow a path from a vertex to itself; if this path contains no edges, then the path length is 0.

- **simple path**: no repeated vertices

- **cycle**: simple path, except that the last vertex is the same as the first vertex

More Terminology

- An undirected graph is connected if there is a path from every vertex to every other vertex.
- A directed graph with this property is called **strongly connected**.

More Terminology

- **subgraph**: subset of vertices and edges forming a graph
- **connected component**: maximal connected subgraph. E.g., the graph below has 3 connected components.

Examples

G_1

(i)

(ii)

(iii)

(iv)

(a) Some of the subgraph of G_1

G_3

(i)

(ii)

(iii)

(iv)

(b) Some of the subgraph of G_3

Tree and Forests

- **tree** - connected graph without cycles
- **forest** - collection of trees

Examples

Tree

Forest

Connectivity

- Let $n = \text{\#vertices}$, and $m = \text{\#edges}$
- **A complete graph**: one in which all pairs of vertices are adjacent
- *How many total edges in a complete graph?*
 - Each of the n vertices is incident to $n-1$ edges, however, we would have counted each edge twice! Therefore, intuitively, $m = n(n-1)/2$.
- Therefore, if a graph is not complete, $m < n(n-1)/2$

$$n = 5$$

$$m = (5 * 4)/2 = 10$$

More Connectivity

n = #vertices

m = #edges

■ For a tree **m** = **n** - 1

If **m** < **n** - 1, G
is not connected

n = 5
m = 4

n = 5
m = 3

How to store a Graph?

- Adjacent Matrix
 - Adjacent Lists
-

Adjacent Matrix

- Let $G=(V,E)$ be a graph with n vertices.
- The **adjacency matrix** of G is a two-dimensional n by n array, say `adj_mat`
- If the edge (v_i, v_j) is in $E(G)$, `adj_mat[i][j]=1`
- If there is no such edge in $E(G)$, `adj_mat[i][j]=0`
- The adjacency matrix for an undirected graph is symmetric; the adjacency matrix for a digraph need not be symmetric

Examples for Adjacency Matrix

$$\begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

G_1

$$\begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

G_2

$$\begin{bmatrix} 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$

G_4

symmetric

More Adjacent Matrix

- How to get the degree of vertex i ?

vertex=

V_1	V_2	V_3	V_4
-------	-------	-------	-------

arc=

	V_1	V_2	V_3	V_4	
$\left[\begin{array}{cccc} 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 1 \\ \text{---} 0 \text{ ---} 1 \text{ ---} 0 \text{ ---} 0 \text{ ---} \\ 1 & 1 & 0 & 0 \end{array} \right]$	0	1	0	1	V_1
	1	0	1	1	V_2
	0	1	0	0	V_3
	1	1	0	0	V_4

The number of non-zero data in i^{th} row

More Adjacent Matrix

vertex=

V_1	V_2	V_3	V_4
-------	-------	-------	-------

arc=

	V_1	V_2	V_3	V_4	
	0	1	0	1	V_1
	1	0	1	1	V_2
	0	1	0	0	V_3
	1	1	0	0	V_4

How to ensure if there is edge on v_i and v_j ?

Test whether $\text{arc}[i][j]$ is 1

More Adjacent Matrix

vertex=

V_1	V_2	V_3	V_4
-------	-------	-------	-------

arc=

	V_1	V_2	V_3	V_4	
	0	1	0	1	V_1
	1	0	1	1	V_2
	0	1	0	0	V_3
	1	1	0	0	V_4

How to find all adjacent vertices of v_i ?

Traverse all i^{th} row elements, if $\text{arc}[i][j]$ is 1, v_j is the adjacent vertex of v_i

Digraph Adjacent Matrix

vertex=

V_1	V_2	V_3	V_4
-------	-------	-------	-------

arc=

	V_1	V_2	V_3	V_4	
[0	1	1	0	V_1
	0	0	0	0	V_2
	0	0	0	1	V_3
	1	0	0	0	V_4

How to find the out degree of v_i ?

sum all elements on i^{th} row

Digraph Adjacent Matrix

vertex=

V_1	V_2	V_3	V_4
-------	-------	-------	-------

arc=

	V_1	V_2	V_3	V_4	
{	0	1	1	0	V_1
	0	0	0	0	V_2
	0	0	0	1	V_3
	1	0	0	0	V_4

How to find the in degree of v_i ?

sum all elements on i^{th} column

More Adjacent Matrix

- From the adjacency matrix, to determine the connection of vertices is easy
- The degree of a vertex is $\sum_{j=0}^{n-1} adj_mat[i][j]$
- For a digraph (= directed graph), the row sum is the out_degree, while the column sum is the in_degree

$$ind(v_i) = \sum_{j=0}^{n-1} A[j, i] \qquad outd(v_i) = \sum_{j=0}^{n-1} A[i, j]$$

Create Adjacent Matrix

```
buildGraph(int a[ ], int n, int e)
{
    vertexNum=n; arcNum=e;
    for (i=0; i<vertexNum; i++)
        vertex[i]=a[i];
    for (i=0; i<vertexNum; i++)    //initialization
        for (j=0; j<vertexNum; j++)
            arc[i][j]=0;
    for (k=0; k<arcNum; k++)    //get each edge
    {
        cin>>i>>j;    //the vertices of the edge
        arc[i][j]=1; arc[j][i]=1; //adjacency
    }
}
```

Practice Time

- Implement following functions
 - Given a graph, create the adjacent matrix
 - Insert edges between u and v
 - Delete edge between u and v
 - Output the degree of u
 - Output all the adjacent vertices of u
-

Adjacency Lists

- The space complexity of Adjacent Matrix?
- Idea for Adjacency List:
 - For each vertex v_i , using a list to store all adjacent vertices with v_i , which is referred as v_i 's edge list
- Implementation
 - Vector array

G_1

G_3

G_4

An undirected graph with n vertices and e edges $\implies n$ head nodes and $2e$ list node

More Adjacency List

- **degree of a vertex** in an undirected graph
 - # of nodes in adjacency list
- **# of edges** in a graph
 - determined in $O(n+e)$
- **out-degree** of a vertex in a directed graph
 - # of nodes in its adjacency list
- **in-degree** of a vertex in a directed graph
 - traverse the whole data structure

Graph Traversal

- Problem: Search for a certain node or traverse all nodes in the graph
 - Depth First Search
 - Once a possible path is found, continue the search until the end of the path
 - Breadth First Search
 - Start several paths at a time, and advance in each one step at a time
 - Topological Sorting
-

Graph Traversal

- Both graph traversal procedures share one fundamental idea, namely, that it is necessary to mark the vertices we have seen before so we don't try to explore them again. Otherwise we get trapped in a maze and can't find our way out.
 - BFS and DFS differ only in the order in which they explore vertices.
-

Breadth-First Search (BFS)

- A **Breadth-First Search (BFS)** traverses a connected component of a graph, and in doing so defines a spanning tree with several useful properties.
- The starting vertex **s** has level 0, and, as in **DFS**, defines that point as an “anchor.”
- In the first round, the string is unrolled the length of one edge, and all of the edges that are only one edge away from the anchor are visited.
- These edges are placed into level 1
- In the second round, all the new edges that can be reached by unrolling the string 2 edges are visited and placed in level 2.
- This continues until every vertex has been assigned a level.
- The label of any vertex **v** corresponds to the length of the shortest path from **s** to **v**.

BFS - A Graphical Representation

V_1

Result: V_1

V_2 V_3

Result: V_1 V_2 V_3

V_3 V_4 V_5

Result: V_1 V_2 V_3 V_4 V_5

$V_4 V_5 V_6 V_7$

Result: $V_1 V_2 V_3 V_4 V_5 V_6 V_7$

$V_5 V_6 V_7 V_8$

Result: $V_1 V_2 V_3 V_4 V_5 V_6 V_7 V_8$

Code – BFS Using Adjacent Matrix

```
template <class T>
void MGraph::BFSTraverse (int v)
{
    front=rear=-1; //Assuming no overflow
    cout<<vertex[v]; visited[v]=1; Q[++rear]=v;
    while (front!=rear)
    {
        v=Q[++front];
        for (j=0; j<vertexNum; j++)
            if (arc[v][j]==1 && visited[j]==0 ) {
                cout<<vertex[j]; visited[j]=1; Q[++rear]=j;
            }
    }
}
```

Code – BFS Using Adjacent List

```
template <class T>
void ALGraph::BFSTraverse (int v)
{
    front=rear=-1;
    cout<<adjlist[v].vertex;   visited[v]=1;  Q[++rear]=v;
    while (front!=rear)
    {
        v=Q[++front];  p=adjlist[v].firstedge;
        while (p!=NULL)
        {
            j= p->adjvex;
            if (visited[j]==0) {
                cout<<adjlist[j].vertex;  visited[j]=1; Q[++rear]=j;
            }
            p=p->next;
        }
    }
}
```

BFS Usage

- Finding a path

In a maze, how to find a path from the start to the end using least steps?

- Exploiting traversal
